

Geographic Data Science

Introduction

Elisabetta Pietrostefani & Carmen Cabrera

(Self-)Quiz

- Have you ever used data to make decisions in your life?
- Have you ever heard the term “Data Science ”?
- Have you ever written a line of computer code?

Philosophy

- (Lots of) **methods** and techniques
 - General overview
 - Intuition
 - Very little math
 - Lots of ways to continue on your own
- Emphasis on the **application** and **use**
- Close connection to “**real world**” applications

Philosophy

1. This course is like a gym subscription
2. Principles over technology
3. Collaborate, do not copy

Format

- **Concepts:** lectures (website + slides), readings, videos
- **Hands-on:** concepts in (interactive) action
- **Do-It-Yourself:** practical material to do on your own

What is Geographic Data Science?

Geographic Data Science

Geographic Data Science

- **Analyse and extract** insights from geospatial data
- Work with **real-world data** on a number of domains and problems
- Acquire key **data science skills** and important tools to answer spatial questions

It is in very high demand in industry.

Philosophy of Geographic Data Science

Statistician George Box :

All models are wrong, but some are useful In a similar fashion.

Geographer Keith Ord :

All maps are wrong, but some are useful.

In what fields is it useful?

Housing

Transportation

Insurance

Telecommunications

Energy

Retail

Agriculture

Healthcare

Urban planning

And more...

GIS

Layers - Image - Data

GIS world vs. Real World

Skills

Hard Skills

- Programming language
- Transparency and reproducibility
- Version control

Soft Skills

- Communication
- Storytelling
- Geospatial analytics acumen
- Ethical skills

Open Science

Command line interface

Graphical User Interfaces (GUIs)

Open source Geographic Information Systems (GIS), exemplified by software like QGIS, have revolutionized the accessibility of geographic analysis on a global scale. However, they inadvertently introduce a challenge to reproducibility.

Command Line Interfaces (CLIs)

Command Line Interfaces (CLIs) offer a solution to the reproducibility challenge in GIS.

The geodata 'revolution'

Advanced Hardware: High-performance computer hardware combined with efficient algorithms are driving the geospatial data revolution, allowing us to process vast datasets quickly.

Scalable Software: Scalable software solutions are essential for sifting through this data deluge, helping us extract valuable insights from the noise.

Spatial Databases: The advent of spatial databases empowers us to store and manipulate manageable subsets within the vast sea of geographic data.

Logistics

Sessions

- Lectures *and* labs
- **Tuesdays 10-11am** (Lecture 1h)
- **Tuesdays 1-3pm** (Lab 2h approx)
- Keep in touch on Teams!

202324-ENVS563 - Geographic Data Science ⚡

👤 Assign to

✎ Edit

⋮

Welcome to a course on Geographic Data Science!

The module has three main aims.

- Provide students with core competences in Geographic Data Science (GDS). This includes advancing their statistical and numerical literacy and introducing basic principles of programming and state-of-the-art computational tools for GDS;
- Present a comprehensive overview of the main methodologies available to the Geographic Data Scientist, as well as their intuition as to how and when they can be applied;
- Focus on real world applications of these techniques in a geographical and applied context.

All the content for this module has been compelled in a book and available through an external website [\[HERE ↗\]](#).

We will use this website throughout the term.

Welcome

This is the website for the “Geographic Data Science” module **ENVS363/563** at the University of Liverpool. This is course designed and delivered by Dr. Elisabetta Pietrostefani and Dr. Carmen Cabrera-Arnau from the Geographic Data Science Lab at the University of Liverpool, United Kingdom. Much of the course material is inspired by Dani Arribas-Bel’s [course on Geographic Data Science](#).

This module will introduce students to the field of **Geographic Data Science (GDS)**, a discipline established at the intersection between Geographic Information Science (GIS) and Data Science. The course covers how the modern GIS toolkit can be integrated with Data Science tools to solve practical real-world problems.

Core to the set of employable skills to be taught in this course is an introduction to programming tools. Students will be able to whether to develop their skills in either R or Python in Lab sessions.

The website is **free to use** and is licensed under the [Attribution-NonCommercial-NoDerivatives 4.0 International](#). A compilation of this web course is hosted as a GitHub repository that you can access:

- As an [html website](#).
- As a [GitHub repository](#).

Teams

The screenshot displays the Microsoft Teams interface. On the left sidebar, the 'All teams' section shows the selected team 'ENVS363/563 25-26-0365-Team'. Below the team name, there are links for 'Class Notebook', 'Assignments', 'Grades', 'Reflect', and 'Insights'. Under the 'Main Channels' section, a list of channels is visible: 'General' (selected), 'Lab 1 - Open Science', 'Lab 2 - Spatial Data', 'Lab 3 - Mapping Vector Data', 'Lab 4 - Mapping Raster Data', 'Lab 5 - Points', 'Python - Environment set up', and 'R- Environment Set up'.

The main chat area shows the 'General' channel. At the top, there are tabs for 'General', 'Posts', and 'Files'. A post by 'Pietrostefani, Elisabetta' from Monday 16:01 is displayed. The post content reads: 'Welcome to ENVS363/563! Let me introduce the team. [Cabrera, Carmen](#) and I will be co-teaching this module. We also have some wonderful demonstrators who will be helping out during labs. Please feel free to introduce yourself in this thread. Looking forward to meeting you all next week! 📖 📌'. Below the post, there is a 'Reply' button.

Let's have a look

Assignments

Assignment I

Title: Programmed Map

Due date: 5th November 2026 (week 6)

40% of the final mark

Assignment II

Title: Computational Essay

Due date: 10th December 2026 (week 11)

60% of the final mark

Both assignments are **Tier 3** for Generative AI: *exploratory / critical use*

Generative AI: both assignments are Tier 3

Tier 3 — Structural scaffold: exploratory / critical use

Generative AI tools (ChatGPT, Copilot, Claude...) are broadly **allowed and encouraged** for **specific stages or tasks** in both assignments.

Engage **actively** with AI: **generate, critique, iterate, refine** — to build your **AI literacy**.

AI is **not the primary producer** of your work: if you can't explain or justify it yourself, it's an **Academic Integrity concern**.

Generative AI — Tier 3 evidence required

Every submission must include **evidence of how you used AI**, for example:

- **Summary account** of how AI was used: which tool, for which part (narrative/code), and how
- **Key AI interactions:** prompts, outputs, and your edits
- **Critical evaluation** of the AI contributions: what helped, what was wrong or needed changing
- **Cite or attribute** AI use where appropriate

Generative AI — what to declare

- **Narrative:** your own words — AI proof-reading that changes wording/structure must be declared
- **Code:** AI support is fine, but you must be able to explain every line
- **Undisclosed use found later = penalty**, not just a missing declaration

Full declaration form: gdsl-ul.github.io/gds/ai-declaration.html

Do not invent data with AI

Rain or sun? UK average chance of rain

Average daily chance of rain, 24 September – 1 October 2026 (8-day forecast)

Dots show the 8-day mean at 19 places; colours between them are interpolated (inverse-distance weighting), so this is an indicative picture, not small-area data. Forecast retrieved 24 September 2026. Boundaries: Natural Earth via world-atlas.

Which map is not AI-generated

- **Clear question:** a bivariate map comparing total hours of sunshine with total annual rainfall. Black areas have plenty of both.
- **Named, citable data:** from the Met Office ([Hollis et al.](#))
- **Documented method:** produced in R
- **Reproducible:** [replication code here](#)
- **Credited author:** plot by @VictimOfMaths

Critical thinking: questions to ask of any map

1. **Where does the data come from?** Is a source named, and can you find it?
2. **What is measured?** Variable, year, units
3. **Can you read it?** Is there a legend, and does it match what's on the map?
4. **Could you reproduce it?** Is there data and code you can re-run?
5. **Does it pass a sanity check?** Does the pattern match what you already know?

Put your answers in your **Tier 3 evidence**: what AI produced, and how you checked it.

More Help

This course is much more about *learning to learn* and **problem solving** rather than acquiring specific programming tricks or stats wizardry.

- Learn to ask questions (but don't expect exact answers all the time!!!)
- **Help others** as much as you can (the best way to learn is to teach)
- Search heavily on **Google + Stack Overflow**, and now **AI tools** too (check what they give you, and declare your use)

Workflow

come to the **Lectures**

1. Go over the Concepts sections of each week after the lecture
2. Have a look at the Readings and/or videos
3. Record questions and post them on Teams prior to the lab

Workflow

come to the **Labs**

1. Come work through the code and DIY sections
 2. Live answers to questions posted
 3. Support from your lecturers and demonstrators
- Hands on!
 - Collaborate *and* participate
